**How has the geography of union petitions evolved over time?
Is there evidence of local contagion?**

NLRB certification elections are valuable microdata

- Industry disaggregation from 1963-2011
- City disaggregation from 1963-present
- High frequency and detail (compared to early surveys)
- Still likely the dominant form of organizing
- Flow can be mapped to stock of union members (Dickens and Leonard, 1985; Schaller, 2022)

Our Contribution

- 1 Merging and cleaning election data
- 2 Generating maps and descriptive analysis
- 3 Estimating local contagion effects

Merging and Cleaning Election Data

- Merging data from NLRB, Farber and Western (2001), Lee and Mas (2012), Holmes (2006)
 - Variables include: votes for/against union, eligible employees, unit type, election type, employer and union names (sometimes), and closing date
 - Over 250,000 observations covering universe of elections from 1963-2021

Merging and Cleaning Election Data

- Merging data from NLRB, Farber and Western (2001), Lee and Mas (2012), Holmes (2006)
 - Variables include: votes for/against union, eligible employees, unit type, election type, employer and union names (sometimes), and closing date
 - Over 250,000 observations covering universe of elections from 1963-2021
- Detailed cleaning of state and city information
 - Fuzzy string matching → 90-95% of observations
 - Hand clean the remaining 5-10%

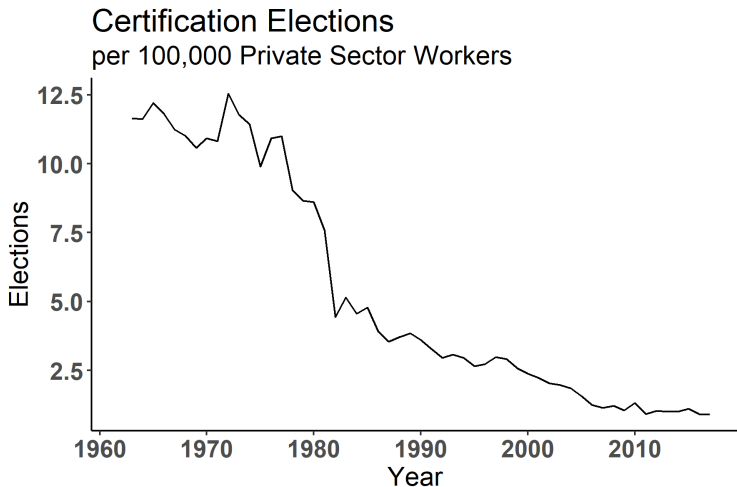

Merging and Cleaning Election Data

- Merging data from NLRB, Farber and Western (2001), Lee and Mas (2012), Holmes (2006)
 - Variables include: votes for/against union, eligible employees, unit type, election type, employer and union names (sometimes), and closing date
 - Over 250,000 observations covering universe of elections from 1963-2021
- Detailed cleaning of state and city information
 - Fuzzy string matching → 90-95% of observations
 - Hand clean the remaining 5-10%
- Linking to demographic variables at county and commuting zone levels
 - Census: race, gender, age
 - QCEW: employment, establishments

Our Contribution

- 1 Merging and cleaning election data
- 2 **Generating maps and descriptive analysis**
- 3 Estimating local contagion effects

Elections Over Time

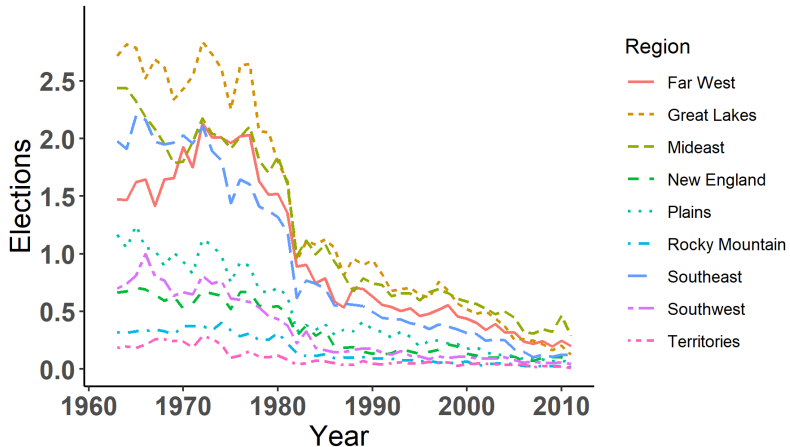

Elections by Sector

Certification Elections per 100,000 Private Sector Workers

Certification Elections per 100,000 Private Sector Workers

Election Success Rate

Pro-Union Vote Share by Region

Voter Participation Rate

Elections per 1000 People in US Cities

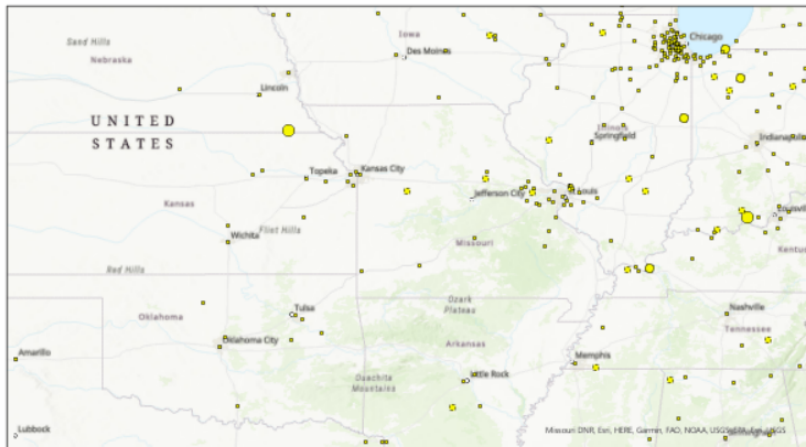

1965 - 1970

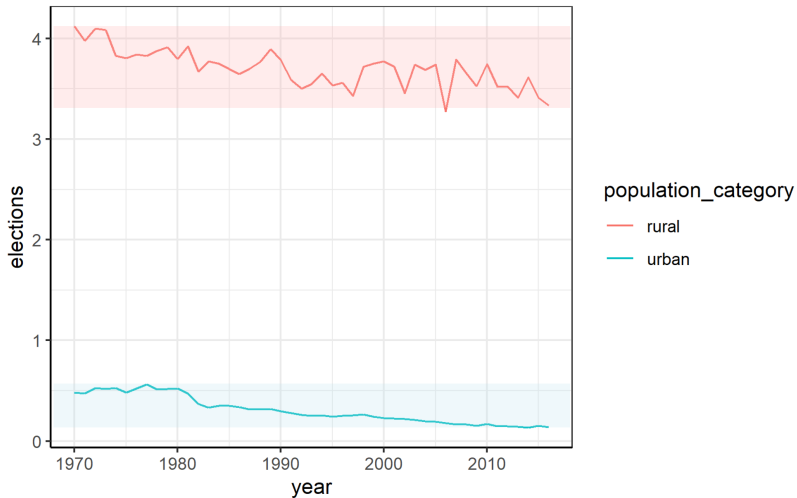

Elections per 1000 People in US Cities

2015 - 2020

- 0.00 - 0.71
- 0.71 - 2.54
- 2.54 - 5.85
- 5.85 - 15.38

Elections/100,000 people Urban vs. Rural

Our Contribution

- 1 Merging and cleaning election data
- 2 Generating maps and descriptive analysis
- 3 Estimating local contagion effects

Empirical Model

$$\text{logit}(\text{Election}_{cm}) = \beta_1 \text{Elect}_{zm-6:1} + \beta_2 \text{Emp}_{cm} + \delta \text{Year} + \gamma_c + \varepsilon_{cm}$$

Alternatively use six month period instead of one month period for dependent variable

Alternatively use pro-union vote share as dependent variable (OLS)

Counties that never had an election were dropped

Results: Election Petitions

	<i>Dependent variable: had election</i>			
	t = month		t = 6 month	
	(1)	(2)	(3)	(4)
spillover	0.002*** (0.00003)	0.002*** (0.00003)	0.001*** (0.0001)	0.001*** (0.0001)

Conclusion

- The decline in elections is common to every sector and every part of the country
- Rates of decline, however, might vary considerably by industry, geography, and demography
- Union formation has become concentrated in urban centers
- We find evidence that elections have very small local contagion effects (odds of having an election in a given county in a given month increase from about 11.5% to 11.7%)
